ASK YOUR OWN AIDE

Your day, handled.

A personal aide for the driver.
Accountable assistance for the responder.

GEMINI | GOOGLE CLOUD | WEB + ANDROID

Working prototype. Vehicle, driving, callers and follow-up actions are simulated; Google AI and provider integrations are real.

An interruption needs a next step.

01

A call on the road

A meeting moves. The conversation creates a reply and a calendar follow-up to remember.

02

A vehicle warning

Charging stops or a tire warning appears. The driver needs a clear, bounded next step.

03

An incident away from a desk

A release fails. The responder must connect evidence, choose a remedy and confirm its result.

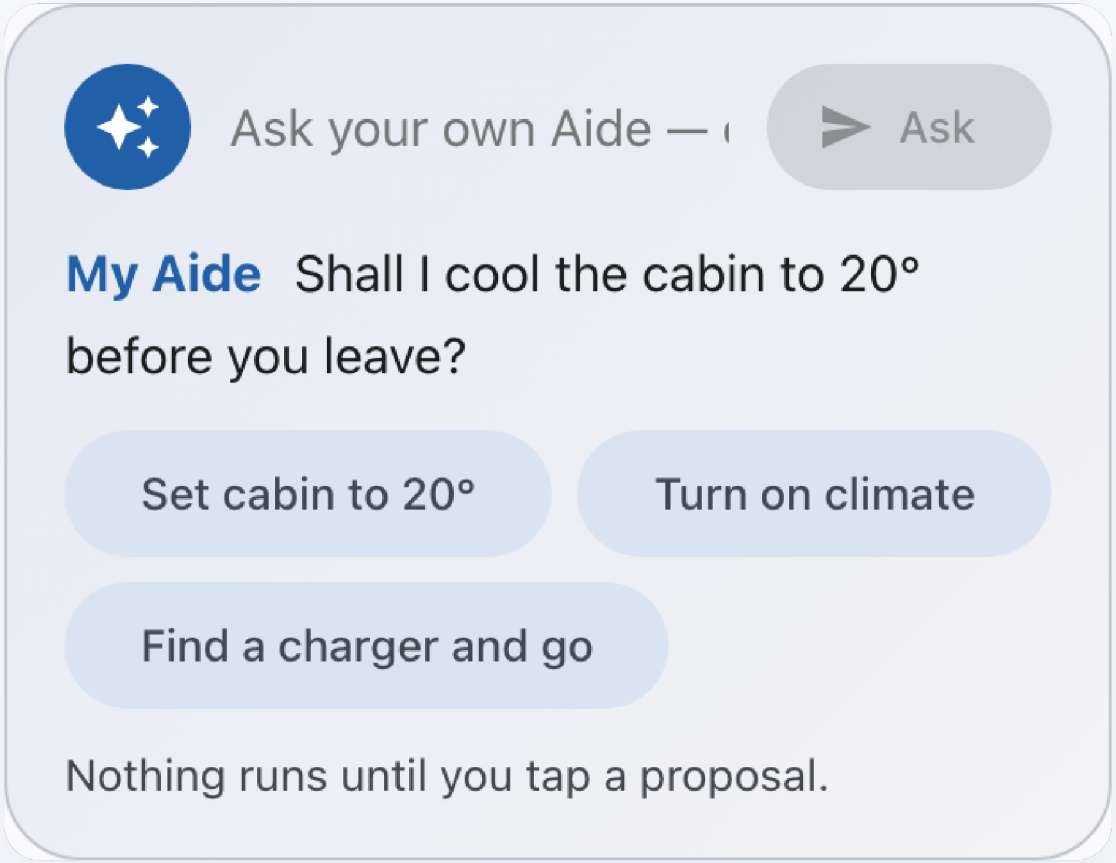

The goal: less coordination between the interruption and a verified outcome.

Design premise, not measured user impact. References: Google SRE: eliminating toil; June 2025 Cloud incident.

Ask. Review. Tap.

“Cool the car to 20° before I leave.”

1. **Ask in your own words.**
   Gemini proposes named actions.
2. **Review the changes.**
   A proposal does not execute.
3. **Tap what you want.**
   The server validates the current state.

Offline synthetic product capture

Real places. Your choice.

“Find a charger nearby and take me there.”

GEMINI

A bounded query

Interprets the request.
Does not choose authority.

→

GOOGLE MAPS MCP

Grounded results

Places, source links and photos.
Attribution stays beside them.

→

THE DRIVER

Select a destination

A Favorite or scoped memory can handle a later match.

Genuine basemaps. Visible cancellation.

Movement is an explicit straight-line simulation.

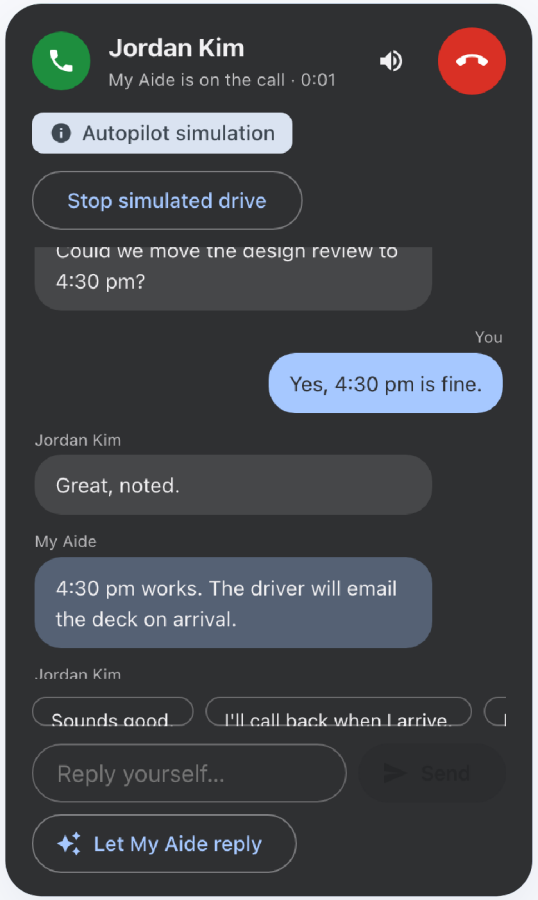

One direct provider flow returned five places with five attributed photos. Tested Seoul road routes were empty; road navigation is not implemented.

Let My Aide take the call.

A meeting moves while you head to a charger.

- Context-aware Gemini turns
- A summary and follow-up drafts
- An explicit tap for simulated sending or scheduling

> **Model waits do not freeze the car.**
>
> Movement and Stop stay usable. A late reply cannot revive a canceled drive.

Offline synthetic product capture

A response you can verify.

KNOWN + AUTHORIZED

One bounded response, then read-back.

A verified charging case and current policy permit one safe simulated reconnection.

UNFAMILIAR OR UNSAFE

Report. Work with a person.

Check the evidence, guide recovery and verify the result before separately approving a future case.

Offline synthetic product capture

Tire/thermal warnings get no invented fix. The earlier guided charging and case/policy lifecycle was exercised in deployment; the pictured state is synthetic.

Autonomy has an edge.

WORK	WHAT AIDE CAN DO	WHAT AUTHORIZES IT
Reads and drafts	Investigate, explain, propose	Current identity and bounded scope
Known charging case	One simulated remedy + read-back	Verified case, active 24-hour policy, safe conditions
Real Cloud Run change	One typed, conditional action	Guardian + exact reviewed state + actual human decision

No model credentials

No generated execution code

No automatic resend after unknown

Simulation policy grants no cloud authority. Current V2 negative checks pass; actual V2 human redemption/conflict remains unverified.

One entry. Separate authority boundaries.

Web + Android Firebase identity · server-verified workspace

↓

Cloud Run gateway + Firestore Typed requests · private state · reviewed grants · durable claims

DRIVER WORKFLOW

Gemini + Maps MCP

Requests, proposals, conversations and the simulated vehicle twin

RESPONDER WORKFLOW

My Aide / Chief

Ops | Diagnosis | Guardian

ADK / A2A · registered Cloud Run evidence

Mobility and cloud response have separate data and change authority. No vehicle-to-backend causal correlation is implemented.

Proof with the gaps visible.

NATIVE + SEPARATE PROVIDER CHECKS

Real AI, identity and Maps

Native sign-in, Ask and Maps passed. Separate draft checks pass; final native flow remains open.

LOCAL + ONE REAL PROVIDER PROBE

Stop survives a model wait

Vehicle/call versions stay independent. Late replies cannot undo Stop or restore revoked data.

EARLIER DEPLOYED WORKFLOW

Verified charging read-back

One simulated 72 kW recovery, with separate case promotion and bounded policy.

STILL OPEN

People and final acceptance

Phone and paired human trial. Current web/final native drafts. Actual V2 reviewer/conflict.

245 API · **74** Android core · **3** app unit · **20** emulator passes · Maps SDK qualified separately

Unknown, separate 429 and deadline retained. Held-out first run 13/18 is not comparable to tuned runs. No measured productivity or MTTR gain.

ASK YOUR OWN AIDE

Your attention is valuable. Give interruptions to My Aide.

Understand the request | Respect the boundary | Verify the next step

For the driver and the responder,
with decisions that remain accountable.
